A Ph.D. candidate working with computational physics/chemistry and developing scientific software. My main research interest is the efficient sampling of molecular structure and thermodynamic properties.

Education

- 2015– **PH.D. CANDIDATE in Physics, Institute of Physics, University of São Paulo**
Implementation and Development of Efficient Algorithm for Intramolecular Deformation with the Monte Carlo Method
CNPq Ph.D. Fellowship - Advisor: Dr. Kaline R. Coutinho
- 2013–2015 **MASTER'S in Computational Physics, São Carlos Institute of Physics, University of São Paulo**
Implementation of the Parallel Tempering Monte Carlo Method to the Study of Thermodynamic Properties of Nanoclusters
FAPESP Master Fellowship - Advisor: Dr. Juarez L. F. Da Silva
- 2009–2012 **B.S. in Computational Physics, São Carlos Institute of Physics, University of São Paulo**
Undergraduate Research with Dr. Leonardo P. Maia: Fluid Dynamics in Porous Media with Lattice Boltzmann -
CNPq Scientific Initiation Fellowship

Complementary Education

- 2015 COURSERA ONLINE COURSE: Algorithms: Design and Analysis, Part 1. (Duration: 36h). Stanford University
- 2006–2008 TECHNICAL COURSE in Informatics, Colégio Divino Salvador

Computational Skills

Proficient with programming languages (from more to less proficient): Fortran (legacy and modern), C, Python, C++ and Bash. I have experience with OpenMP parallelization, code profiling and optimization, and also have knowledge in MPI and Pthreads parallelization.

Research overview

My research is mainly focused on the development of algorithms and computer code to efficiently sample properties of organic molecules and metallic nanoclusters with intricate potential energy surface and/or embedded in solvent. Since molecular properties are often related to their structures, the sampling of molecular conformations is important for studies that goes from energy storage to the development of new drugs. Specifically, I have experience with Monte Carlo methods and extended ensemble methods such as replica exchange. I also have some experience with global optimization and clustering. Recently, my work has been focused on the development of a Bias Monte Carlo method to sample internal degrees of freedom of organic molecules and small peptides in solution, which is the main subject of my Ph.D. thesis. To achieve the objectives of my research, my work rely on high performance computing, and for this reason, I also have some interest in this field.

Software development

Apart from several scripts and smaller software, I am one of the main developers of two scientific softwares:

Cezar HM, Canuto S, Coutinho K

Dice

A Monte Carlo code for the molecular simulation of liquids and gases using classical force fields. My main contribution is the coding and development of a Configurational Bias Monte Carlo method used to sample the internal degrees of freedom of the molecules. The code is written in Fortran and has OpenMP parallelization.

Rondina GG, Cezar HM, Da Silva JLF

GOTNano

A code for global optimization and sampling of thermodynamic properties of nanoclusters. My main contribution is the implementation of the Parallel Tempering Monte Carlo algorithm used to sample the thermodynamic properties. The code is written in C and has OpenMP parallelization.

Publications

IN PRESS

Cezar HM, Rondina GG, Da Silva JLF

Parallel Tempering Monte Carlo Combined with Clustering Euclidean Metrics Analysis to Study the Thermodynamic Stability of Lennard-Jones Nanoclusters

Accepted for publication at *Journal of Chemical Physics* ·

We use a clustering algorithm to analyze trajectories from Parallel Tempering Monte Carlo simulations of Lennard-Jones nanoclusters, identifying the phase changes and most frequent structures with great accuracy using a very simple approach.

A Basin-hopping Monte Carlo Investigation of the Structural and Energetic Properties of 55- and 561-atom Bimetallic Nanoclusters: the Examples of the ZrCu, ZrAl, and CuAl Systems

Journal of Physics: Condensed Matter 28:175302, 2016 · [DOI](#)

We report a basin-hopping Monte Carlo investigation of the structural and energetic properties of bimetallic ZrCu, ZrAl, and CuAl nanoclusters with 55 and 561 atoms, showing how the atoms of the different species are distributed in the structure, and a trend of more spherical structures at 50-50 compositions.
